The problem: How to get accurate egg counts in an egg production environment.

How Rota Technologies, LLC solves the problem with artificial intelligence and machine learning - Automated Vision Egg Counting System.

Accurate egg counting is a must in production environments. With a machine **Vision Egg Counting System**, accuracy is what you get. Egg producers can detect production differences immediately when production results go down and respond more quickly to failures and diseases. Rota's Vision Egg Counting System helps egg producers detect production differences and optimize results.

Machine Vision Technology is more accurate than infrared sensors and mechanical counters.

Real-time insight into the number of eggs per belt, day, hour, and minute. The system displays this data for today, and for the past week. The most important production data is displayed in weekly overviews and saved for 52 weeks.

Vision counting technology eliminates production interruptions due to contamination. The counter is a camera above the belt and much less likely to get dirty which results in a counting system that is even more reliable and accurate.
